Supporting information: this article has supporting information at journals.iucr.org/e

The title compound, C₂₀H₂₃NO₂, was obtained *via* the reaction of *N*-allyl-*N*-phenylacrylamide with 3-iodocyclohex-2-en-1-one using PdCl₂(PPh₃)₂ as a catalyst. The compound crystallizes in the monoclinic space group *P*2₁/*c*. The fused-ring system is not planar and the five- and six-membered rings are *trans*-fused. The molecular geometry is partially stabilized by an intramolecular C—H...O hydrogen bond, forming an *S*(6) ring motif. In the crystal, molecules are linked by C—H...O and C—H... π interactions into a three-dimensional network. To further analyse the intermolecular interactions, a Hirshfeld surface analysis was performed. The results indicate that the most important contributions to the overall surface are from H...H (65.5%), O...H/H...O (17.5%) and C...H/H...C (14.3%) interactions.

1. Chemical context

A cascade reaction is a chemical process that comprises at least two consecutive reactions such that each subsequent reaction occurs only by virtue of the chemical functionality formed in the previous step (Nicolaou *et al.*, 2010; Jash *et al.*, 2019; Knowles *et al.*, 2021). Although cascade reactions have been successfully employed for the synthesis of the core skeleton of many important natural products, the design and performance of cascade reactions remain a challenging aspect of organic chemistry (Zhang *et al.*, 2022; Xie & She, 2021). Meanwhile, alkylation of the α position of enones and their derivatives has drawn considerable attention (Krafft *et al.*, 2005; Muimhneacháin *et al.*, 2017; Shen & Huang, 2008; Zhang *et al.*, 2010; Jana *et al.*, 2021). McGlacken described a Pd-catalysed coupling procedure for tricyclic oxoisochromene derivatives, which represents an example of the α arylation of activated carbocyclic enone-based substrates (Muimhneacháin *et al.*, 2017). Huang and co-workers have realized a series of reactions including Sonogashira coupling, propargyl-allenyl isomerization, and [4 + 2] cycloaddition combined *via* α alkylation of carbocyclic enone-based substrates, affording an efficient and stereoselective synthesis of polycyclic skeletons (Shen & Huang, 2008). Given this background, we report herein the synthesis and crystal structure of the title compound.

Figure 1
The molecular structure of the title compound, with the atom labelling and displacement ellipsoids drawn at the 50% probability level. H atoms are shown as small circles of arbitrary radii.

2. Structural commentary

The title compound crystallizes in the monoclinic crystal system in space group $P2_1/c$. Its molecular structure is shown in Fig. 1. The structure of a racemic compound possesses a disordered enantiomer layout (Jacques *et al.*, 1994) and atoms C8 and C9 are found to be disordered. They were both split into two fragments (C8/C22 and C9/C21) and were refined. This refinement led to a 0.805 (10):0.195 (10) occupancy ratio over two positions for C8 and C9. The site occupancies of C8, C9 and C21, C22 are 0.805 (10) and 0.195 (10), respectively. The fused ring system is not planar. The sp^2 -hybridized character of atoms C12 and C13 is confirmed by the C12–C13 [1.350 (3) Å] bond length, and the C11–C12–C15 [114.9 (2)°] and C14–C13–C18 [116.3 (2)°] bond angles. There is a strong intramolecular hydrogen bond (C2–H2···O1; Table 1), forming an $S(6)$ ring motif.

3. Supramolecular features

The crystal packing of the title compound (Fig. 2) features intermolecular C–H···O hydrogen bonds and C–H··· π

Figure 2
A packing diagram of the title compound. The C–H··· π and C–H···O interactions are shown as dashed lines.

Table 1
Hydrogen-bond geometry (Å, °).

Cg3 is the centroid of the C1–C6 ring.

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
C2–H2···O1	0.93	2.24	2.864 (3)	124
C3–H3···O2 ⁱ	0.93	2.53	3.4513 (3)	170
C11–H11A···Cg3 ⁱⁱ	0.97	2.73	3.688 (3)	168
C11–H11D···Cg3 ⁱⁱⁱ	0.97	2.95	3.688 (3)	134
C14–H14A···Cg3 ⁱⁱⁱ	0.97	2.70	3.609 (3)	156
C14–H14D···Cg3 ⁱⁱⁱ	0.97	2.90	3.609 (3)	131

Symmetry codes: (i) $x + 1, -y + \frac{3}{2}, z + \frac{1}{2}$; (ii) $x, -y + \frac{3}{2}, z + \frac{1}{2}$; (iii) $x, -y + \frac{3}{2}, z - \frac{1}{2}$.

interactions (C3–H3···O2ⁱ; C11–H11···Cg3ⁱⁱ and C14–H14A···Cg3ⁱⁱⁱ or C11–H11D···Cg3ⁱⁱⁱ and C14–H14D···Cg3ⁱⁱⁱ; symmetry codes are given in Table 1). In the crystal, molecules are stacked together layer by layer. Molecules in same layer are linked by C3–H3···O2 interactions, forming a layer parallel to the ab plane (Fig. 2); Molecules in different layers are linked by C11–H11A···Cg3 and C14–H14A···Cg3 or C11–H11D···Cg3 and C14–H14D···Cg3 interactions (Fig. 2). In order to investigate the intermolecular interactions in a visual manner, a Hirshfeld surface analysis was performed using *CrystalExplorer* (Spackman & Jayatilaka, 2009; Turner *et al.*, 2017). The bright-red spots on the Hirshfeld surface mapped over d_{norm} (Fig. 3) indicate the presence of C–H··· π and C–H···O interactions. The absence of adjacent red and blue triangles on the shape-index map (Fig. 4) suggests that there are no notable π – π inter-

actions. The fingerprint plots (Fig. 5) are given for all contacts, and those delineated into C···O/O···C (0.4%), O···N/N···O (0.5%), C···C (0.7%), N···H/ H···N (1.0%), C···H/H···C (14.3%), H···O/O···H (17.5%) and H···H (65.5%). The most important contributions to the crystal packing are H···H and O···H/H···O contacts.

4. Database survey

A search of the Cambridge Structural Database (Version 2021.1; Groom *et al.*, 2016) for compounds having a

Two-dimensional fingerprint plots for the title compound: (a) all intermolecular interactions, (b) H···H contacts, (c) O···H/H···O contacts, (d) C···H/H···C contacts, (e) N···H/H···N contacts, (f) C···C contacts, (g) O···N/N···O contacts, (h) C···O/O···C contacts.

3,3a,4,6,7,8,9,9a-octahydro-1*H*-benzo[*f*]isoindole-1,5(2*H*)-dione fragment gave two hits, including 2a,8,9b-trimethyl-3,4,6,6a,9a,9b-hexahydro[2]benzofuro[1,7-*ef*]isoindole-2,5,7,9-(2*aH*,8*H*)-tetrone (**I**) (Florke, 2019) and 2-ethyl-12,12-dimethyl-4,6,7,8,9,9a-hexahydro-1*H*-4,9-[1,2]-epicyclobutabenzofuro[*f*]isoindole-1,3,5(2*H*,3*aH*)trione (**II**) (Ma & Gu, 2006). In these two structures, the fused-ring systems are not planar. Compound **I** crystallizes in the monoclinic crystal system, space group *P*2₁. The five- and six-membered rings are *cis*-fused. The crystal structure is characterized by the presence of C—H···O hydrogen bonds. Compound **II** crystallizes in the orthorhombic crystal system, space group *Pbca*. The molecules are linked by C—H···O hydrogen bonds, and the crystal packing also features C—H··· π interactions.

5. Synthesis and crystallization

N-Allyl-*N*-phenylacrylamide (0.30 mmol), 3-iodocyclohex-2-en-1-one (0.36 mmol), PdCl₂(PPh₃)₂ (5 mol%, 0.015 mmol, 10.5 mg), TCAB (3,4,3',4'-tetrachloroazobenzene) (10 mol%, 0.03 mmol, 8.33 mg) and K₂CO₃ (0.36 mmol, 49.68 mg) were stirred in DMSO (5.0 mL) at 403 K in a 20 mL tube under an N₂ atmosphere. When the reaction was complete (detected by TLC), the mixture was cooled to room temperature. The reaction was quenched with HCl (5%, 10 mL) and extracted with Et₂O (3 × 10 mL). The combined organic layers were dried over anhydrous MgSO₄ and then evaporated under vacuum. The residue was purified by column chromatography on silica gel using *n*-hexane/ethyl acetate (10:1 *v:v*) as eluent to afford the compound as a white solid. Part of the purified product was redissolved in *n*-hexane/ethyl acetate and colourless crystals suitable for X-ray diffraction were formed after slow evaporation for several days.

Spectroscopic data: IR (film) 2962, 2920, 2885, 1687, 1662, 1619, 1169, 757 cm⁻¹; ¹H NMR (500 MHz, CDCl₃): δ = 7.64–7.62 (*m*, 2H), 7.41–7.37 (*m*, 2H), 7.18–7.15 (*m*, 1H), 3.96–3.93 (*m*, 1H), 3.68–3.64 (*m*, 1H), 2.92–2.90 (*m*, 1H), 2.64–2.61 (*m*, 1H), 2.43–2.27 (*m*, 6H), 2.12–2.09 (*m*, 2H), 1.10 (*s*, 3H), 1.03 (*s*, 3H) ppm; ¹³C NMR (125 MHz, CDCl₃): δ = 198.8, 173.7, 153.8, 139.6, 130.7, 128.9, 124.4, 119.6, 53.0, 51.4, 45.7, 45.1, 36.6, 33.1, 32.3, 29.4, 27.1, 26.3 ppm.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. All H atoms were positioned geometrically with C—H = 0.93–0.98 Å and refined as riding atoms. The constraint $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ or $1.5U_{\text{eq}}(\text{C-methyl})$ was applied in all case. Atoms C8 and C9 are disordered over two positions (*A* and *B*) in a 0.805 (10):0.195 (10) occupancy ratio.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger. The C(8) and C(9) is disordered over two positions, site occupancies were refined. This refinement led to a 0.805 : 0.195 ratio in occupancy over two positions for C(8)and C(9).
