Impact of accreditation on health care services performance in Kiryandongo district, Uganda: a longitudinal study

Moses Matovu^{1*}, Elias Musiime¹, Patrick Olak², Muhammad Mulindwa¹, Eve Namisango¹ and Kilian Songwe¹

Abstract

Background: The COVID-19 pandemic has emphasised the need for quality laboratory services worldwide. There is renewed focus to strengthen country capacities and laboratories to effectively respond to public health emergencies and patient outcomes. Uganda launched the accreditation program for public health facilities in 2016 with sixteen laboratories. As of June 2021, twenty-three public laboratories have attained ISO 15189:2012 accreditation status. Despite the tremendous achievements of accrediting laboratories in Uganda, laboratory services still face challenges like stock out of commodities and limited testing scopes. We conducted this study to evaluate the impact of accreditation on health care services performance in *Kiryandongo* district, Uganda.

Methods: We conducted a longitudinal study from January 1, 2020- April 30, 2021 at ten health facilities in *Kiryandongo* district. We collected health care services performance data from the MoH dhis-2 on selected indicators for HIV, TB, Malaria, Laboratory, Maternal & child health and dhis-2 reporting. We used Generalized Estimating Equations to estimate the impact of accreditation on health care services performance at the different health facilities.

Results: The odds at the accredited facility in comparison to the non-accredited public facilities were; 14% higher for ART enrolment (OR = 1.14, 95% CI: 1.04–1.25), 9% lower for determine testing kits stock out (OR = 0.91, 95% CI: 0.85–0.97), 28% higher for TB case diagnosis (OR = 1.28, 95% CI: 1.10–1.49), 19% higher for TB case enrolment (OR = 1.19, 95% CI: 1.04–1.36), 104% higher for maternity admissions (OR = 2.04, 95% CI: 1.60–2.59), 63% higher for maternity deliveries (OR = 1.63, 95% CI: 1.39–1.90) and 17% higher for reporting hmis 10:01 data to dhis-2 (OR = 1.17, 95% CI: 1.04–1.31).

The odds at the accredited facility in comparison to the non-accredited PNFP facilities were; 26% higher for ART enrolment (OR = 1.26, 95% CI: 1.17-1.36), 33% higher for TB case diagnosis (OR = 1.33, 95% CI: 1.15-1.55), 24% higher for TB case enrolment (OR = 1.24, 95% CI: 1.09-1.42), 136% higher for maternity admissions (OR = 2.36, 95% CI: 1.89-2.94), 76% higher for maternity deliveries (OR = 1.76, 95% CI: 1.51-2.04) and 2% higher for reporting of hmis-10:01 data to dhis-2 (OR = 1.02, 95% CI: 1.01-1.03).

Conclusions: HIV, TB, laboratory, MCH, and reporting to dhis-2 selected indicators were positively impacted by accreditation. This impact translated into increased health care services performance at the accredited facility as compared to the non-accredited facilities.

Background

The COVID-19 pandemic has emphasized the need for improved health care and quality laboratory services worldwide [1]. There is renewed focus to strengthen country capacities and laboratories to promptly and effectively respond to public health risks, emergencies and patient health care [2]. Strengthened laboratory services are vital in the response to public health risks, epidemics, pandemics, health care improvement and attainment of national and international development goals like the UNAIDS 95–95-95 and Sustainable Development Goals [3].

Over the last decade, there has been remarkable improvement in health care performance in resource limited settings due to adoption of quality management systems [4]. The implementation of quality management systems is viewed as a long term, viable, sustainable solution to the vast challenges affecting health services in resource limited settings [5].

Quality management systems like laboratory accreditation have been utilized in developed countries to enhance patient health care and laboratory competencies [6–8]. Accredited systems, provide credible laboratory results, strengthen cross data exchange, decrease costs, wastage and improve health care services performance [9].

Quality Management System initiatives like the Strengthening Laboratory Quality Management Systems Towards Accreditation/Stepwise Laboratory Quality Improvement Process Towards Accreditation (SLMTA/SLIPTA) have been rolled out to many resource limited countries such as Uganda with remarkable results [10, 11].

Uganda adopted the SLMTA/SLIPTA program in 2010 to strengthen the delivery and quality of laboratory services at all health care levels. Over time, laboratories that attained the required performance on the SLMTA/SLIPTA program were supported to attain international accreditation status by the implementing, development partners and Ministry of Health (MoH).

Further on, Uganda launched the accreditation program for public facilities in 2016 with sixteen laboratories. The laboratories were supported through provision of technical assistance that included specialized training, mentorships, evaluations and application for accreditation assessment to the South Africa National Accreditation Service (SANAS). As of June 2021, twenty three (23) public laboratories have attained ISO 15189:2012 accreditation status with more laboratories in the pipeline for international accreditation [12].

Despite the tremendous achievements accrued by the implementation of laboratory quality management system initiatives in Uganda, laboratory services still face challenges including stock out of health commodities, inadequate human resource, limited testing scopes and

inadequate funding [13, 14]. These challenges compromise health care performance, and attainment of national and international goals. In addition, health care developments like universal health care coverage, patient centred health care and the ambitious sustainable development health goals are raising the bar for health and laboratory systems to produce better health care performance [15].

There is need to establish impactful health care system models that best suit resource limited settings without compromising the quality of health care and patient safety. Since the establishment, implementation and sustenance of quality management systems such as accreditation entail significant investment, assessing the impact of these systems on health care services is crucial.

We therefore designed this study to evaluate the impact of accreditation on health care services performance at three health facility categories in *Kiryandongo* district, Uganda. The findings from the study inform key stakeholders and MoH on the impact of implementing the accreditation model at the various health facilities in *Kiryandongo* district, Uganda.

Methods

Study design

We conducted a longitudinal study from January 1, 2020 to April 30, 2021 at ten health facilities in *Kiryandongo* district, Uganda.

The health facility categories were defined as:

- a) Accredited public: defined as MoH owned health facility that has attained ISO 15189:2012 status;
- b) Non-accredited public: defined as MoH owned health facility that has not attained ISO 15189:2012
- c) Non-accredited PNFP: defined as a private not for profit health facility that has not attained ISO 15189:2012 status.

Study setting

Kiryandongo district is one of the 146 districts in Uganda [16]. The district is found approximately 218 km north of Kampala (the capital city of Uganda) in the mid-western part of Uganda (Latitude:2.0000; Longitude:32.3000) at the intersection of Uganda's prime productive northern and southern regions.

The 2021 population projection by the Uganda Bureau of Statistics (UBOS) recorded *Kiryandongo's* population at 322,300, of which 163,100 (50.6%) are males and 159,200 (49.4%) are females [17]. *Kiryandongo* district also hosts refugees from South Sudan, internally displaced persons from the Lord's Resistance Army rebel

activities, and person's displaced by the Eastern region's *Bududa* landslides of 2010 [18].

The district has thirty-nine (39) health facilities constituting of twenty-one (21) Government, fourteen (14) Private for Profit and four (4)-Private not for profit (PNFP). These facilities serve the population of *Kiryandongo* and the surrounding districts of *Masindi, Nakasongola, Oyam, Apac, Amuru* and *Nwoya*. Ten (25.6%) of the health facilities are at Health Center III (HC III) and General Hospitals also provide laboratory services [19].

The General Hospitals offer a variety of services including; Out-patient, Inpatient, Opthalmology, X-ray, Ultra sound, Orthopedics, Health promotion, Health education, Occupational therapy, HIV, Immunization, Environmental health, Special clinics, Support supervision to the lower-level health facilities among other services [19].

Kiryandongo General Hospital (KGH) and Restoration Gateway Hospital provide the highest level of health care services within the district. Kiryandongo General Hospital has a Biosafety Level II laboratory that has been accredited to ISO 15189:2012 since 2018 (SANAS #: M0624) [20].

The HC IIIs within the district provide basic preventive, promotive, curative care, support supervision of the lower-level facilities under their jurisdiction. The HC IIIs also provide maternal & child care services and first level referral cover at the sub county level [19].

Study procedure

We selected all health facilities at the HC III and General Hospital level. This was because of the availability of laboratory services at these levels. We collected health care services performance data from the MoH dhis-2 on a quarterly basis on selected HIV, TB, Malaria, Laboratory services, Maternal & child health and reporting to dhis-2 indicators. Data on the baseline characteristics of the health facilities was obtained from the National Health facility Inventory [19]. We used Generalized Estimating Equations to estimate the impact of accreditation on health care services performance at the different health facility categories.

The study was approved by the *Kiryandongo* District Health Team as an exempt study. This was because the study utilized secondary data and did not require the collection of any identifiable data from any participants.

Study variables

Independent variable

The independent variable was accreditation status of the health facility and was categorized as; Accredited public, Non-accredited public and Non-accredited PNFP.

Dependent variable

The dependent variable was health care services performance defined as aggregated data on selected HIV, TB, Malaria, Laboratory, Maternal Child & Health and dhis-2 reporting indicators obtained from the MoH dhis-2 system.

We adapted the Global indicator framework for the Sustainable Development Goals and targets of the 2030 Agenda for Sustainable Development and designed health care performance indicators for critical public health concerns in Uganda as shown Table 1 [21]. Health care performance was measured as a non-composite variable for each of the selected indicators.

Statistical analysis

Descriptive analysis was undertaken to profile the health facilities by level of service delivery, type of ownership, accreditation status and catchment population. Categorical variables were summarised by percentage. Continuous variables were summarised by median and inter quartile range (IQR).

Prior to analysis, all data were tested for normality using the Shapiro-Wilk test and for homogeneity of variances by Levene's test. To assess differences in health care services performance across and between the health facility categories, non-parametric tests, Kruskal-Wallis and Mann-Whitney test were performed. Performance was considered significant at p < 0.05.

We used a Generalized Estimating Equation (GEE) model to model the quarterly clustered data within each health facility and estimated the impact of accreditation on the health care services performance at the health facility categories.

Results

Baseline characteristics

A total of ten facilities (10) participated in the study. Table 2 describes the baseline characteristics of the facilities.

By level of health service delivery 80% (8/10) of the facilities were HC III. By type of ownership, 60% (6/10) of the facilities were public, 90% (9/10) of the facilities were not accredited and 20% (2/10) of the facilities had a catchment population of 500,000 people.

Health care services performance

We used the Kruskal-Wallis tests to assess the differences in the health care services performance across the health facility categories. Performance was considered significant at p < 0.05. Table 3 describes the comparison of the health care services performance across the health facility categories.

Table 1 Health care services performance and indicators

Health Care Service performance	Indicators
1.)HIV	1.1 Number of new clients enrolled on ART,
	1.2 Days out of stock for ART
	° Tenofovir/Lamivudine/Dolutegravir (TDF/3TC/DTG),
	° Abacavir/Lamivudine (ABC/3TC)],
	1.3 Days out of stock for HIV testing kits
	° Determine test kits,
	° Sat Pak test kits
2.)TB	2.1 Number of TB cases identified,
	2.2 Number of TB cases diagnosed;
	2.3 Number of TB cases enrolled
	2.4 Days out of stock for GeneXpert cartridges
3.)Malaria	3.1 Number of malaria cases identified
	3.2 Number of malaria cases diagnosed
4.)Maternal and Child health	4.1 Number of maternity admissions,
	4.2 Number of maternity deliveries,
	4.3 Number of BCG immunisations administered
	4.4 Number of Pentavalent immunisations administered
	4.5Number of children dewormed
5.)Laboratory services	5.1 Number of samples referred to the laboratory,
	5.2 Number of Hepatitis B samples tested
6.)Reporting to dhis-21.)	6.1 Percentage of Hmis 10: 01 data (attendances, referrals, TB) reported,
	6.2 Percentage of hmis 10:10 data (laboratory) reported

Impact of accreditation on health care services performance

We used Generalized Estimating Equations (GEE) modelling to estimate the impact of accreditation on the health care services performance at the different health facility categories. We selected the health care services performance indicators which achieved a statistical significance of $P \le 0.2$ at the bivariate level (Table 2) as the outcome variables. The categorical independent variable was selected as the factor and the health facility catchment population as the covariate. A cut off P-value of < 0.05 was adopted for statistical significance. The results from the GEE analysis are shown in Table 5.

Discussions

This study examined the impact of accreditation on health care performance at three health facility categories in *Kiryandongo* district, Uganda.

Accreditation positively impacted the selected indicators; new clients on ART, TB case diagnosis, TB case

enrolment, malaria case diagnosis, laboratory sample referral, maternity admissions, maternity deliveries, immunisations and reporting to dhis-2 for hmis 105:10.

Accreditation did not however impact the indicators for; days out of stock for ART medication (TDF/3TC/DTG, ABC/3TC) and Hepatitis B Testing.

HIV services performance

The accredited facility was more likely to enrol new HIV patients on ART (OR=1.14) in comparison to the non-accredited public facility and (OR=1.26) in comparison to the non-accredited PNFP. Furthermore, the accredited facility was less likely to experience stockouts for HIV testing kits (OR=0.91- Determine, OR=0.87-StatPak) in comparison to the non-accredited public facility. The difference in new enrolments for HIV and days out of stock for HIV testing kits at the accredited facility were statistically significant, P < 0.05. The accredited facility however had higher stockouts for antiretroviral medication (OR=1.05-TDF/3TC/DTG,

PNFP Private Not for Profit

OR = 1.07- ABC/3TC). The difference in stockout of antiretroviral medication at the accredited facility was however not statistically significant, P > 0.05.

The HIV performance at the accredited facility can be explained by the increased community awareness of the facility's accreditation status and improved stock management of the HIV testing supplies by the laboratory and the facility. This may have resulted into an increased utilization of the HIV services at the facility. These results are similar to those obtained by Ebong et al., in Cameroon who reported customer satisfaction of up to 64% for the adult volunteers attending HIV Infection Testing and Service Delivery at an accredited treatment Centre [22]. A similar study by Billong et al., in Cameroon, reported an increase in HIV testing performance (sensitivity by 10.2% and specificity by 0.3%) following implementation of quality systems interventions in PMTCT programs [23].

TB services performance

The accredited facility was more likely to identify, diagnose and enrol TB cases (OR=1.06, 1.28, 1.19 respectively) compared to the non-accredited public facilities. Similarly, the accredited facility was more likely to identify, diagnose and enrol TB cases (OR=1.47, 1.33, 1.24 respectively) compared to the non-accredited PNFP facilities. The difference in TB case diagnosis and enrolments at the accredited facility were statistically significant, P < 0.05. Further on, the accredited facility had lower stockouts for GeneXpert cartridges (OR=0.78) compared to the non-accredited public facilities. The difference in days out of stock for TB GeneXpert cartridges at the accredited facility was statistically significant, P < 0.05.

The TB services performance at the accredited facility may be explained by the improved stock management, reduced reagent wastage and reduced service interruptions. In addition, the implementation of the National TB program activities such as support supervision by the district health teams, weekly reporting, blinded rechecking and GeneXpert external quality assurance within *Kiryandongo* district may also have contributed to this performance [24]. The National TB program activities aim at strengthening the implementation of TB activities in *Kiryandongo* district and the country at large.

Our findings are similar to those by Getahun et al., in Ethiopia who reported establishment of an effective inventory management system that enabled laboratory supplies forecast, reduced reagent wastage and service interruptions to tuberculosis direct sputum smear microscopy services. A similar study by Susanne Homolka et al., in Germany reported an increase in odds ratio by 108% for a sample to be tested as microscopically positive following implementation of Quality Management Systems [25, 26]. Furthermore, a study by Brugueras et al. in Spain reported significant differences in TB treatment and management for sample collection, documentation of final results, management of resistance, coordination with other departments, contact tracing and directly observed treatment for accredited TB units when compared to the non-accredited units [27].

Malaria services performance

The accredited facility identified and diagnosed less malaria cases (OR=0.62, 0.46 respectively) compared to the non-accredited public facilities. The accredited facility however identified and diagnosed more malaria cases than the non-accredited PNFP facility (OR=2.16, 2.07 respectively). The difference in malaria identification and diagnosis at the accredited facility was statistically significant, P < 0.05.

The findings for malaria performance at the non-accredited public facilities are in tandem with the role played by the HCIIIs as the first level referral cover for laboratory testing in the district. This is aimed at preventing decongestion at the higher levels of health care by the common conditions in the district. The findings at the non-accredited PNFPs may also be explained by the nominal fees being charged for malaria testing whereas in the public facilities, testing is paid for by the MoH hence free to the public.

The Malaria performance findings emphasize the need to implement quality management systems at the lower health facilities that constitute a large bulk of malaria treatment. Our findings are in tandem with those obtained by Thomson et al., in Tanzania [28] and Dorkenoo et al., who showed that the implementation of quality management systems, refresher training and expanded PT at remote testing facilities are essential for improving the quality of malaria diagnosis [29].

Laboratory services performance

The accredited facility was also more likely to receive referral samples (OR = 1.67) as compared to the non-accredited public and PNFP facilities. The difference in sample referral to the accredited facility was statistically significant, P < 0.05. This finding may be explained by the designation of the accredited facility as a hub for the district by MoH. The facilities within the district are mandated to refer samples for viral load testing, early infant diagnosis among other tests to the National Reference Laboratories through the hub system [30].

Further on, the accredited facility was more likely to conduct Hepatitis B testing compared to the non-accredited public and PNFP facilities ($OR=1.04,\ 1.24$ respectively). The difference in Hepatitis B testing at the accredited facility was however not statistically significant, p>0.05. This finding may be due to the implementation of the National Hepatitis B activities such as free testing, mass vaccination campaigns conducted at the different health facilities in the district. These activities are in line with MoH's agenda of advancing the fight against Hepatitis B disease [31].

Maternal and child health services

The accredited facility was more likely to register maternity admissions, maternity deliveries, BCG immunisations and pentavalent immunisation (OR=2.04, 1.63, 1.66, 1.18 respectively) compared to the non-accredited public facilities.

Similarly, the accredited facility was more likely to register maternity admissions, maternity deliveries, BCG immunisations and pentavalent immunisation (OR = 2.36, 1.76, 1.79, 1.26 respectively) compared to the non-accredited PNFP facilities. The difference in maternity admissions, maternity deliveries, BCG immunisations and pentavalent immunisation at the accredited facility were statistically significant, p < 0.05.

The maternal performance at the accredited facility may be explained by the increased community awareness of accreditation of the facility that resulted into increased utilization of the facility maternity and child health services. Our findings are in tandem with the results by El-Shal et al., who showed that accreditation in Egypt was associated with significant improvements in child morbidity, family planning, and delivery care [7]. Similarly, Chao-Wen et al., in South West China, reported improvements in in a new born screening program for indicators including new born health education provision, dried blood sampling, turnaround time, new born recall after positive primary screening following implementation of a comprehensive quality management system [32].

Reporting to dhis-2 performance

The accredited facility was more likely to report to dhis-2, data for hmis 10:01 (attendances, referrals) compared to the non-accredited public and PNFP facilities (OR = 1.17, 1.02 respectively). The difference in reporting for hmis 10:01 data at the accredited facility was statistically significant, p < 0.05.

In addition, the accredited facility was more likely to report to dhis-2, data for hmis 10:10 (laboratory) compared to the non-accredited PNFP facilities (OR = 1.04) and less likely compared to the non-accredited public facilities (OR = 0.74). The difference in reporting for hmis 10:10 data at the accredited facility was however not statistically significant, p > 0.05.

The reporting to dhis-2 performance may be explained by MoH requirement to the health facilities to report health care services performance through the dhis-2 system. The performance for reporting at the accredited facility may also be explained by the improved records & data management and compliance to the reporting standard operating procedures by MoH.

Our findings are in tandem with the results by Maddux et al., who showed increased compliance by 22% with reporting standards for accredited laboratories [33]. A similar study by Kibet et al., reported improvement in critical value reporting by 33 and 40% improvement for laboratory Turn Around Time following accreditation [34].

Results of this study complement what is stated within the literature about the positive impact of accreditation on quality improvement [35–40]. A systematic review that examined different aspects of the hospitals like bed sizes, geographic regions, teaching status, ownership, disease areas and service types reported that accreditation may have a positive impact on efficiency, safety, effectiveness, timeliness and patient-centeredness [41].

Whereas the benefits of accreditation are well documented, implementation and compliance to accreditation requirements are challenging and demanding, requiring active involvement from all key stakeholders to sustain the accreditation status [42, 43]. However, the investment in accreditation yields positive returns as demonstrated in this study.

This study had limitations including utilization of secondary data, as a result we could not eliminate bias from unobserved variables about the health facilities. A follow-up study with a more robust design, such as prospective cohort, should be conducted. In addition, the study was conducted within the period of the COVID-19 pandemic which also included the national lockdown. The lock down restricted patient movements, and impacted logistics and supply chain mechanisms which could have affected stock availability at the respective health

facilities. It is possible that the health performance could have been higher than what was eventually captured.

Conclusions

HIV, TB, Laboratory services, Maternal & child health and reporting to dhis-2 performance indicators were positively impacted by accreditation. This impact translated into increased health care performance at the accredited facility compared to the non-accredited facilities.

The attainment of accreditation comes with several requirements which may include facility upgrades, building personnel capacity, establishing functional equipment management programs and participation in external quality assurance programs. These requirements often form barriers for resource limited settings to realize accreditation, especially if the value for investment is not demonstrated. Accreditation programs of health laboratories should however be encouraged and supported to improve the standard of health care services and patient safety given the positive impact demonstrated by this study.

Acknowledgments

We would like to thank the Ministry of Health-Uganda for their contribution to the health care services performance within *Kiryandongo* district. We thank the staff of *Kiryandongo* General Hospital especially the management and laboratory for evaluating the health care services performance. We thank the *Kiryandongo* district health team for their assistance in administration and review of the facility performance.

Authors' contributions

M.M1 and E.M: Conceptualized, designed the study and wrote the main manuscript text. M.M1 and P.O: Collected the data for the manuscript and reviewed the developed manuscript. M.M1 and M.M2: Collected, analysed the data for the manuscript and reviewed the manuscript text. E.N: Provided guidance to the data analysis process and reviewed the developed manuscript. S.K: Reviewed the final manuscript and approved it for submission for publication. All authors read and approved the final manuscript for submission for publication.

Funding

None.

Availability of data and materials

The datasets used and/or analyzed during the study are available from the corresponding author and can be provided on request.

Declarations

Ethics approval and consent to participate

The *Kiryandongo* District Health Team approved this investigation as an exempt study because the study did not require the collection of any identifiable data from any participants. Study data was obtained from the national dhis-2 system. No administrative permission was required to access the raw data from the national dhis-2 system.

Consent for publication

Not applicable.

Competing interests

1st author supported *Kiryandongo* General Hospital for 1 year as a national mentor from May 2017–May 2018.

3rd author worked as District Laboratory Focal Person and member of district health team for *Kiryandongo* district.

The authors declare that they have no conflict of interest.
