Based on UHPLC-Q/Orbitrap MS/MS analysis from Aqueous Extract of WLM

LC analysis was conducted on an UltiMate 3000 UHPLC system (Thermo-fisher Scientific) equipped with an ACQUITY UPLC HSS T3 column (2.1 × 100 mm, 1.8 μm, Waters, Ireland) at a temperature of 35 °C. The mobile phase consisted of 0.1% formic acid in water (A) and acetonitrile (B), with a gradient elution from 3 to 20% B for 5 min, 20-30% B, 5-11 min; 30-50% B, 11-15 min; 50-65% B, 15-17 min; 65-100 % B, 18-20 min, 100% B. The flow rate was 0.4 mL·min^{-1}.

MS data were acquired on a Thermo-Fisher Scientific Q-Orbitrap mass spectrometer using a HESI source. The HESI parameters were set as follows: capillary temperature and aux gas heater temperature were 320°C and 350°C, respectively; spray voltage was 3.0 kV in the positive mode and 2.8 kV in the negative mode; and sheath gas (N_2) was 40 arbitrary unit (arb) and auxiliary gas (N_2) was 10 arb (N_2, 99.9% purity). The average collision cracking energy (NCE) was ± 35 V while the scanning range was m/z 100−1500. Data acquisition was carried out using Xcalibur 4.2 software (Thermo-fisher Scientific).

Table S1 Evaluation of disease activity index

score	rate of weight loss (%)	degree of loose stools	degree of bleeding
0	0	normal stools	no bleeding
1	1-5	-	-
2	6-10	loose stools (dry)	slight bleeding
3	11-20	-	-
4	$>$20	watery diarrhea	gross bleeding

Table S2 Scoring system for histopathology

Score	The severity of inflammation	The lesion depth	Crypt damage	Lesion range
0	none	none	none	none
1	mild	mucosal layer	basal 1/3 damaged	10%-25%
2	general	submucosal layer	basal 2/3 damaged	26%-50%
3	moderate	muscle layer	only surface epithelium intact	51%-75%
4	severe	transmural	entire crypt and epithelium lost	76%-100%

Scoring system for histopathology = The lesion depth + Crypt damage +(The severity of inflammation + Lesion range)/2.

Table S3 Primer sequences used for real-time qPCR amplification.

Gene	Primer	Sequence (5´-3´)

Dss, DSS group; Con, Control group; WLM, WLM high dose group. FC, Fold Change.

Figure S1 Total ion chromatogram of WLM aqueous extract based on UHPLC-Q/Orbitrap MS (A); HE staining of heart, liver, spleen, lung, and kidney in normal C57 mice after consecutive administration of WLM for 7 days (B).
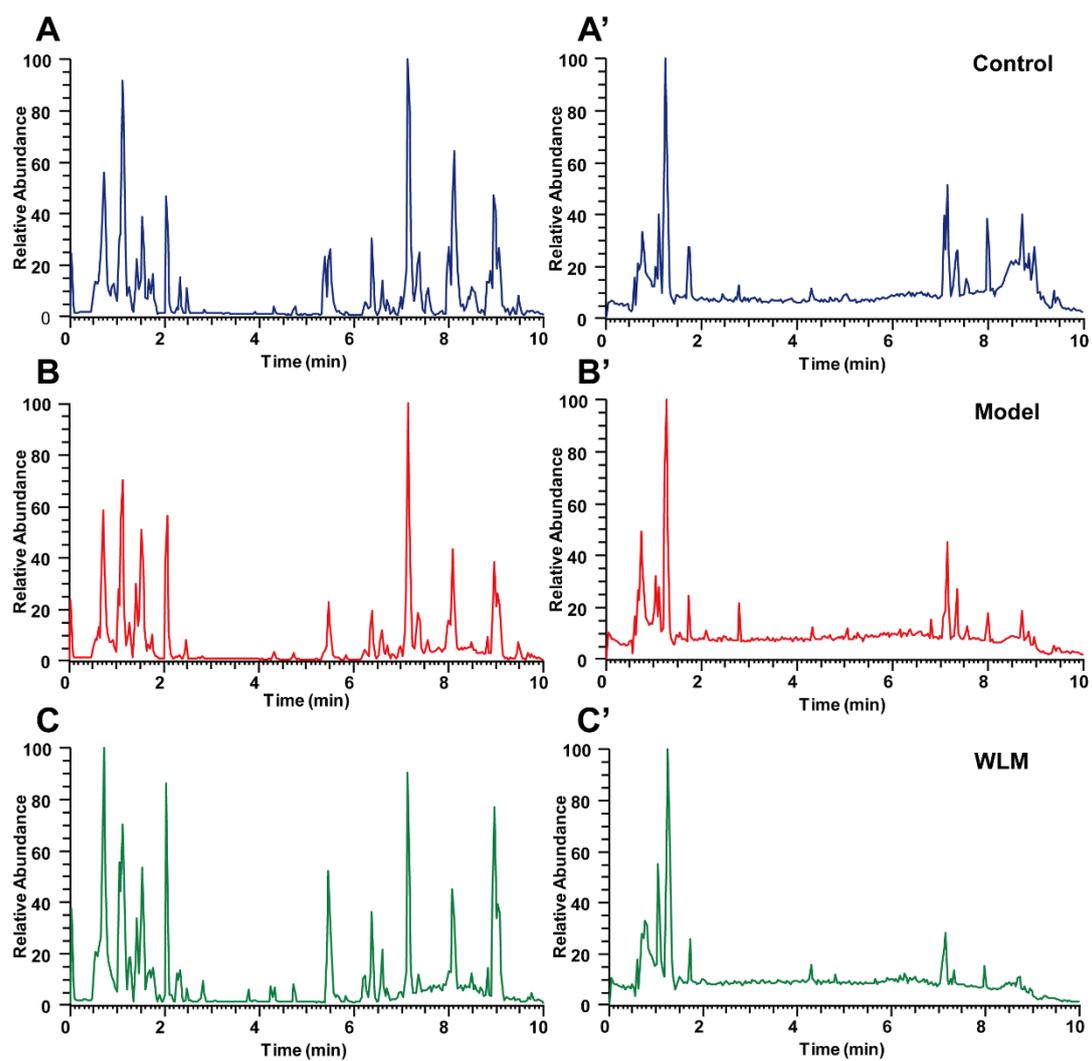

Figure S2 The typical TIC chromatography of mice colon tissue (A, B, and C in the negative mode;
A', B', and C' in the positive mode).

**Figure S3** The relative levels of differential metabolites based on UHPLC-Q/Orbitrap MS analysis

Figure S4 ^{1}H NMR spectra of mice colon tissue from the Control, Model, and WLM group (A). (B) and (C) are permutations analysis for the mice colon tissue based on ^{1}H-NMR analysis, respectively.
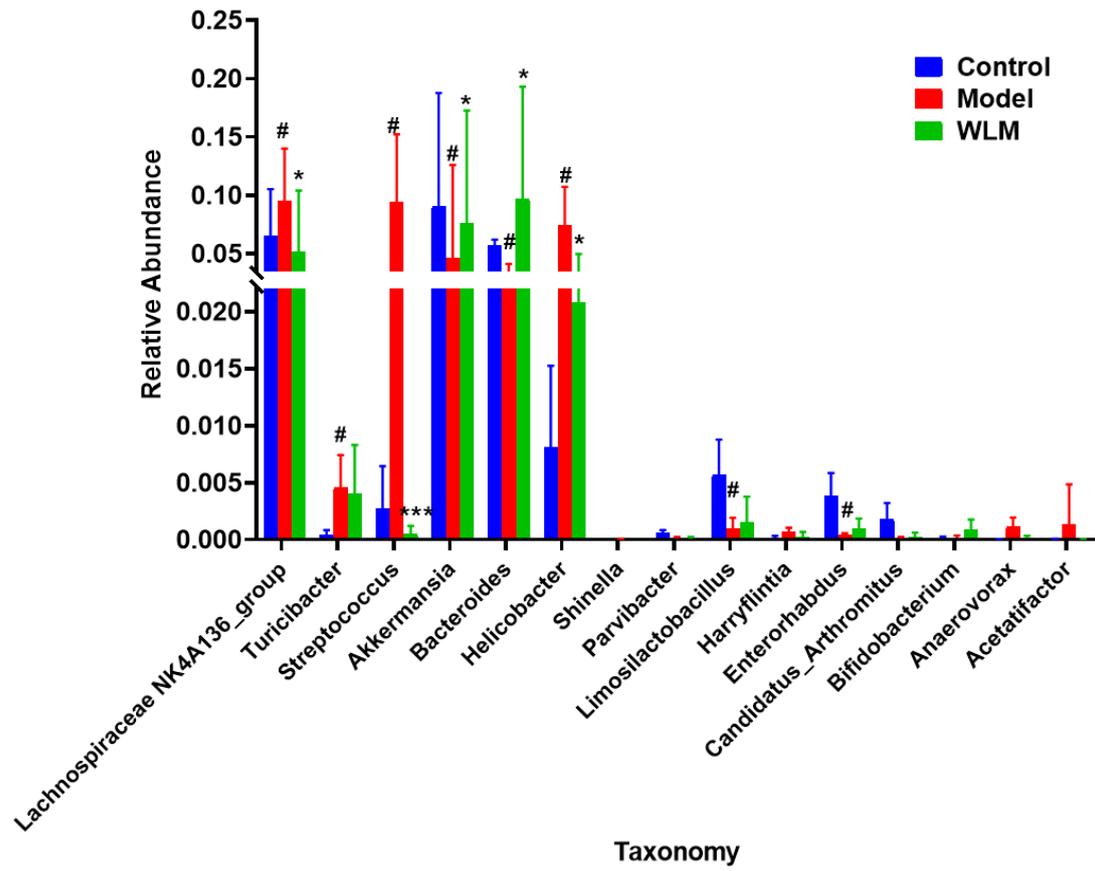

Figure S5 The relative content of differential gut microbes at the genus level.
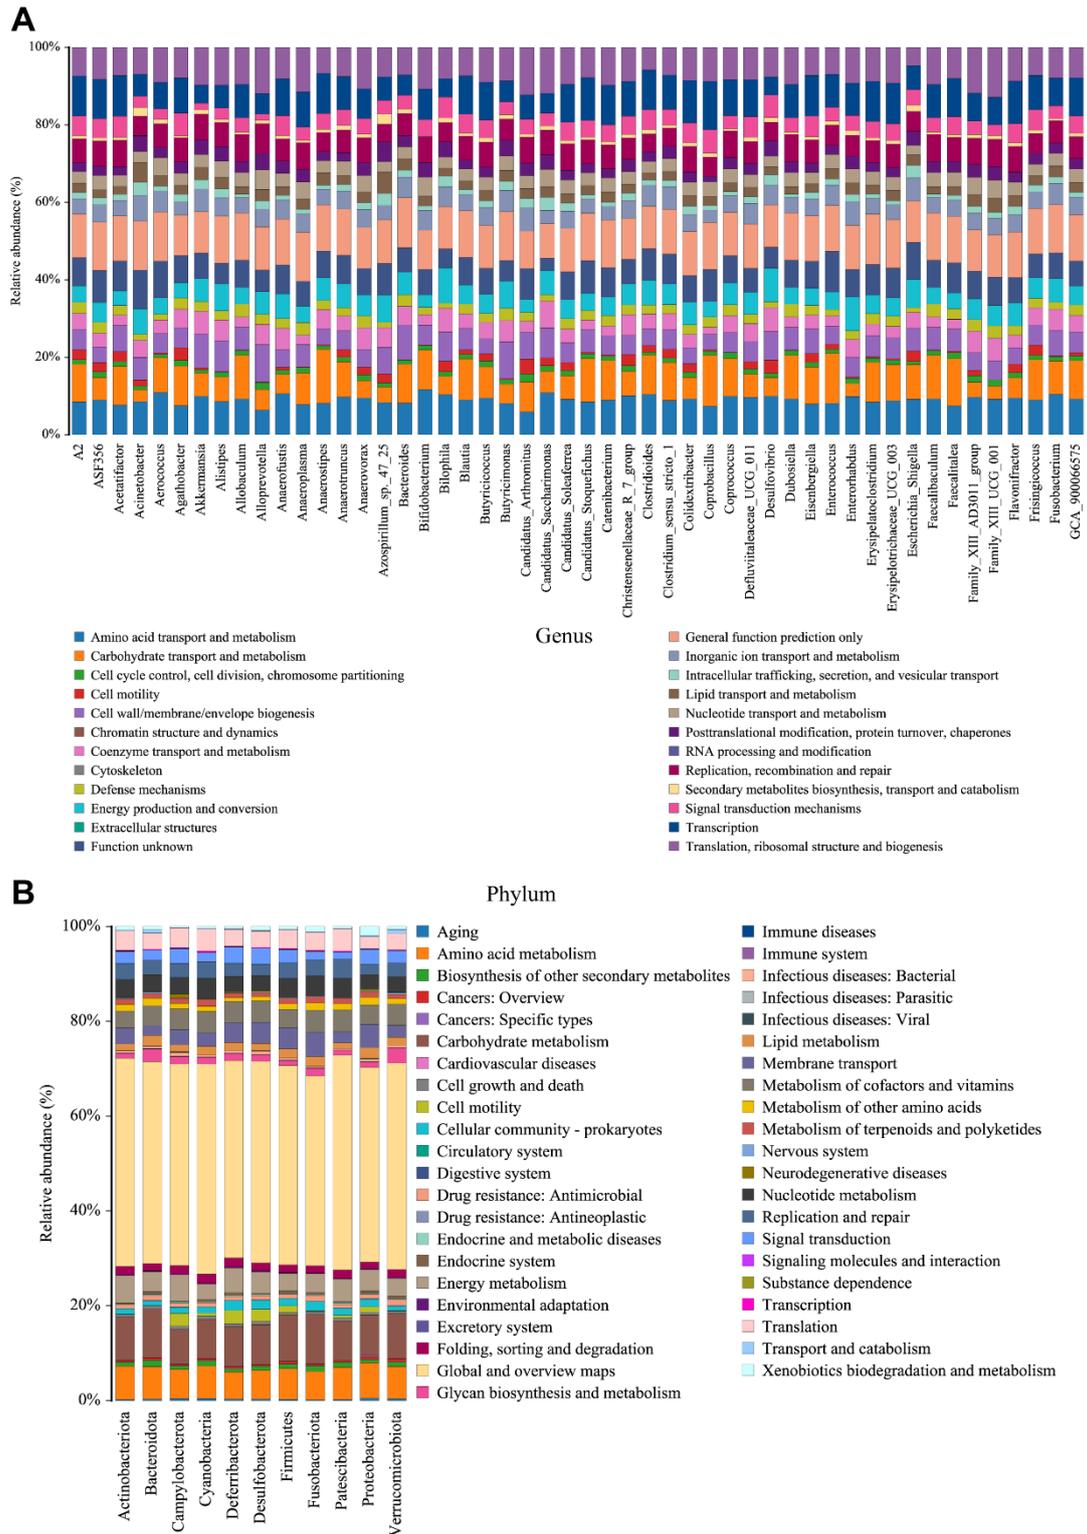

Figure S6 The analysis of metabolic pathways in the gut microbiota at the genus level (A) and phylum level (B).

Figure S7 Heat map of spearman correlation matrix between differential metabolites and gut microbiota; (A), spearman correlation matrix heat map between differential metabolites and inflammatory factors (B); spearman correlation matrix heat map between differential metabolites and gut microbiota (C).
