**ABSTRACT** Three Gram-negative bacteria and one Gram-positive bacterium were isolated from environmental samples in an undergraduate microbiology class on the basis of antibiotic resistance. Isolate DNA was purified, sequenced, and assembled using a hybrid approach. Here, we report the genomes of *Acinetobacter johnsonii* CSUSB1, *Aeromonas hydrophila* CSUSB2, *Bacillus velezensis* CSUSB3, and *Comamonas thiooxydans* CSUSB4.

Four isolates were sequenced using the Oxford Nanopore Technologies MinION platform and the Illumina iSeq100 platform, and their genomes were assembled using a hybrid assembly approach. Initial isolations, 16S rRNA gene characterizations, and preliminary MinION sequencing were performed in an undergraduate medical microbiology course.

*Acinetobacter johnsonii* CSUSB1 was isolated from pond water in Highland, California. *Aeromonas hydrophila* CSUSB2 and *Comamonas thiooxydans* CSUSB4 were isolated from a water tank housing *Alligator mississippiensis* on the California State University, San Bernardino (CSUSB) campus. Pond and alligator water samples were plated on tryptic soy agar (TSA) plates and grown at 30°C for 7 days with five antibiotic disks. Isolates near the disks were restreaked and then retested for resistance. Colonies exhibiting resistance to the antibiotic disks (ampicillin, all isolates; erythromycin, CSUSB2 and CSUSB4; gentamicin and streptomycin, CSUSB2) were streaked for isolation on TSA plates. Single colonies were picked into 100  $\mu$ L of sterile water, boiled, and centrifuged for one minute at maximum speed. The universal 16S rRNA gene primers 27f and 1492r were used to amplify the 16S rRNA gene (1) from the supernatant, and then the gene was sequenced (Retrogen Inc., San Diego, CA) using the universal 16S rRNA gene primer 530f (1). The genera of the isolates were determined using nucleotide BLAST (2), and the best hits were as follows: CSUSB1, GenBank accession number [MK184297](#); CSUSB2, GenBank accession number [NR\\_118547](#); CSUSB4, GenBank accession number [NR\\_029161](#).

Genomic DNA (gDNA) for sequencing was extracted from a single colony after overnight growth in LB broth. A high-molecular-weight DNA extraction protocol (3) was used for the MinION sequencing, and the Wizard SV gDNA kit (Promega, Madison, WI) was used for the iSeq100 sequencing. Genomic libraries were prepared using the rapid barcoding library preparation kit SQK-RBK004 (Oxford Nanopore Technologies, Oxford, UK) for the MinION sequencing and the Nextera XT library preparation kit (Illumina, San Diego, CA) for the iSeq100 sequencing.

Default parameters were used for all of the following software unless otherwise specified. MinION reads (R9.4.1 flow cell) were demultiplexed with Deepbiner v 0.2.0 (4) and base called with Guppy Basecaller v 2.3.1 using the high-accuracy flip-flop algorithm (5), and adapters were removed with Porechop (Galaxy v 0.2.3) (6). FastQC (Galaxy v 0.72) and Trimmomatic (Galaxy v 0.36.5) were used to identify and clip iSeq100 reads with quality scores of <25 (7). Assembly of the long-read-only data sets

using Unicycler (Galaxy v 0.4.8.0) (6) and subsequent BLAST searches led to the discovery of *Acinetobacter* isolate stock culture contamination with *Bacillus velezensis* CSUSB3. The mixed stock culture was restreaked on TSA plates, and isolated colonies were restreaked for isolation. Single colonies were picked, and gDNA was reisolated. Both isolate gDNA samples were sequenced on the iSEQ100 system, and isolated CSUSB3 gDNA was resequenced on the MinION system (R9.4.1 flow cell). The new CSUSB3 MinION reads were used as known contamination in the Unicycler (Galaxy v 0.4.8.0) long-read alignment parameters. This allowed us to use the data from the original MinION run to assemble the genome of CSUSB1.

A total of 12 circular contigs (4 chromosomes and 8 plasmids) were assembled by Unicycler (Galaxy v 0.4.8.0) (8) (Table 1). GToTree (9) was used to identify each isolate's closest relative, and then the two-way average nucleotide identity (ANI) was used to confirm this designation (10) (Table 1).
