Redox potential prediction

ABSTRACT

The data here-in presented is associated to the research article, Electrochemistry and spectroscopy of substituted $[\text{Ru}(\text{phen})_3]^{2+}$ and $[\text{Ru}(\text{bpy})_3]^{2+}$ complexes [1].

Redox data obtained from cyclic voltammetry experiments of the oxidation of Ru(II) to Ru(III) of thirteen Ru(II)-polypyridine complexes is presented in this data in brief article. Data is obtained from the cyclic voltammograms at scan rates of two orders of magnitude ($0.05\text{--}5.00 \text{ Vs}^{-1}$) under similar experimental conditions, namely in acetonitrile as solvent and tetrabutylammonium hexafluorophosphate as supporting electrolyte, and reported versus the redox couple of Fe(II) of ferrocene.

1. Data

This article presents redox data of 13 octahedral Ru(II) complexes, 1–13, containing bipyridine-, substituted bipyridine-, phenanthroline- and substituted phenanthroline ligands, see Fig. 1 for the series of complexes of this data study. Presented data is related to the research article

Specifications Table

Subject area	Chemistry
More specific subject area	Electrochemistry
Type of data	Table, text file, graph, figure
How data was acquired	BAS 100B/W electrochemical analyzer.
Data format	Raw and Analyzed.
Experimental factors	Synthesized samples were used. Degassed the solvent-electrolyte solution, in this case acetonitrile, in the electrochemical cell with Ar(g) for approximately 10 min. Sample addition to the acetonitrile-electrolyte solution and degassed for approximately 3 minutes. A blanket of Ar(g) was maintained in the cell for the duration of the electrochemical analysis. Electrochemical analyses of all the samples were done in an electrochemical cell (2mL), containing a glassy carbon working electrode, Pt reference electrode and a Pt auxiliary electrode.
Experimental features	The electrochemical cell was connected to a BAS 100 B/W electrochemical analyzer and the obtained data was moved to Excel for data analysis and diagram preparation.
Data source location	Department of Chemistry, University of the Free State, Nelson Mandela street, Bloemfontein, South Africa.
Data accessibility	Data is with article.
Related research article	Deidré van der Westhuizen, Karel G. von Eschwege and Jeanet Conradie, Electrochemistry and spectroscopy of substituted $[Ru(phen)_3]^{2+}$ and $[Ru(bpy)_3]^{2+}$ complexes, <i>Electrochimica Acta</i> , https://doi.org/10.1016/j.electacta.2019.07.051 .

Value of the Data

- This data provide cyclic voltammograms of the Ru^{III/II} redox couple of thirteen polypyridine complexes of Ru(II).
- This data provide electrochemical data of the Ru^{III/II} redox couple of thirteen polypyridine complexes of Ru(II) for scan rates 0.05–5.0 $V s^{-1}$.
- This data illustrate the influence of differently functionalized polypyridine ligands on the ease of oxidation of Ru^{II/III} in thirteen Ru(II) polypyridine complexes.
- Redox data of a complex is a key component in order to determine its suitability to be used as redox indicator, catalyst and photo-active mediator in dye-sensitized solar cells (DSSC) [2]

“Electrochemistry and spectroscopy of substituted $[Ru(phen)_3]^{2+}$ and $[Ru(bpy)_3]^{2+}$ complexes” [1]. Redox data of these Ru(II) complexes are important for application as redox indicators, catalysts and photo-active mediators in dye-sensitized solar cells (DSSC) [3,4]. Electrochemical data obtained from cyclic voltammograms at scan rates 0.05 $V s^{-1}$ – 5.00 $V s^{-1}$ (Figs. 2–14, 0.10 $V s^{-1}$ scans from Ref. [1]), are tabulated in Tables 1–13.

2. Experimental design, materials, and methods

Electrochemical studies utilizing cyclic voltammetric measurements were done on a BAS100B Electrochemical Analyzer linked to a personal computer, utilizing BAS100W Version 2.3 software. Measurements were done at 293 K. Successive experiments under the same experimental conditions showed that all formal reduction and oxidation potentials were reproducible within 0.005 V. Cyclic voltammetric measurements were performed on 0.005 mol dm^{-3} solutions of the complex, dissolved in CH_3CN , containing 0.200 mol dm^{-3} tetrabutylammonium hexafluorophosphate (TBAPF₆, $[NBu_4]^+$ $[PF_6]^-$) as supporting electrolyte. Measurements were conducted under a blanket of purified Argon. A three-electrode cell consisting of a Pt auxiliary electrode, a glassy carbon (surface area $3.14 \times 10^{-6} m^2$)

working electrode and a Pt-wire pseudo reference electrode were used. The working electrode was polished on a Buhler polishing mat; first with 1 μm and lastly with $\frac{1}{4}$ micron diamond paste. Scan rates were between 0.05 and 5.00 V s^{-1} . All experimental potentials were referenced against the redox couple of ferrocene FcH/FcH⁺ (IUPAC) [5].
