Received 16 September 2009; accepted 2 November 2009

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; disorder in main residue; R factor = 0.079; wR factor = 0.212; data-to-parameter ratio = 12.2.

The asymmetric unit of the title compound, $C_{21}\text{H}_{21}\text{N}_5\text{O}_3$, consists of two geometrically similar molecules. The fused rings of the triazolo[4,5-*d*]pyrimidine system are nearly coplanar, making dihedral angles of 1.48 (18) and 1.34 (16) $^\circ$, and the phenyl rings are twisted by 12.3 (1) and 8.7 (1) $^\circ$ with respect to the triazolopyrimidine plane. The ethyl groups of the *n*-butyl side chains are disordered over two sites in each of the independent molecules, the ratios of occupancies being 0.60:0.40 and 0.61:0.39.

Comment

The derivatives of heterocycles containing 8-azaguanine system, which are well known bioisosteres of guanine, are of great importance because of their remarkable biological properties, such as antimicrobial or antifungal activities (Roblin *et al.*, 1945; Ding *et al.*, 2004), encephaloma cell inhibitor (Mitchell *et al.*, 1950; Levine *et al.*, 1963), antileukemia (Montgomery *et al.*, 1962), hypersusceptibility inhibitor and acesodyne activities (Yamamoto *et al.*, 1967; Bariana, 1971; Holland *et al.*, 1975).

In recent years, Zhao's group succeeded in synthesizing the derivatives of 8-azaguanine *via* aza-Wittig reaction of beta-ethoxycarbonyl iminophosphorane with aromatic isocyanates (Zhao, Xie *et al.*, 2005). As a continuation of the quest for new biologically active derivatives of 8-azaguanine, the title compound was obtained from beta-ethoxycarbonyl iminophosphorane and aliphatic isocyanate and structurally characterized.

The asymmetric unit of the crystal of the title compound, $C_{21}H_{21}N_5O_3$, consists of two geometrically similar molecules (Fig. 1), the bond lengths and angles in triazolopyrimidinone moiety are in good agreement with those observed for a closely related structures (Zhao, Hu *et al.*, 2005; Zhao, Wang & Ding, 2005). The fused rings of the triazolo[4,5-*d*]pyrimidine ring system are as usual coplanar (e.g. see structures by Wang *et al.*, 2006 and Zeng *et al.*, 2009), and the phenyl rings are twisted with respect to the triazolopyrimidine plane by 12.3 (1) $^\circ$ and 8.7 (1) $^\circ$ in each of the two independent molecules.

Experimental

To the solution of carbodiimide, prepared according to Zeng *et al.* (2006) in a mixed solvent (CH_2Cl_2/CH_3CN , 1:4 *v/v*, 15 ml), was added 4-chlorophenol (3 mmol) and K_2CO_3 (6 mmol). After the reaction mixture was stirred for 12 h, the solvent was removed under reduced pressure and the residue was recrystallized from EtOH to give the title compound in 93% yield (m.p. 426 K). Elemental analysis: calculated for $C_{21}H_{21}N_5O_3$: C, 64.44; H, 5.41; N, 17.89%. Found: C, 63.62; H, 5.68; N, 17.51%. Crystals suitable for X-ray diffraction study were obtained by recrystallization from hexane and dichloromethane (1:3 *v/v*) at room temperature.

Refinement

All H atoms were placed in the geometrically calculated positions and treated as riding atoms, with C—H = 0.93–0.97 Å, and $U_{iso}(H) = 1.2U_{eq}(C)$ [$1.5U_{eq}(C)$ for methyl H atoms]. The terminal ethyl groups of the n-butyl substituent are disordered in both molecules; the occupancy refinement yielded ratio 0.60 : 0.40 and 0.61 : 0.39 for each of the two molecules. The bond lengths and the 1,3-distances in these groups were restrained during the refinement to be within the ranges of 1.54 ± 0.01 Å and 2.45 ± 0.01 Å respectively.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.079$	H-atom parameters constrained
$wR(F^2) = 0.212$	$w = 1/[\sigma^2(F_o^2) + (0.0878P)^2 + 0.7377P]$ where $P = (F_o^2 + 2F_c^2)/3$

$S = 1.07$	$(\Delta/\sigma)_{\max} < 0.001$
6940 reflections	$\Delta\rho_{\max} = 0.44 \text{ e \AA}^{-3}$
567 parameters	$\Delta\rho_{\min} = -0.22 \text{ e \AA}^{-3}$
12 restraints	Extinction correction: none
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
