

Since January 2020 Elsevier has created a COVID-19 resource centre with free information in English and Mandarin on the novel coronavirus COVID-19. The COVID-19 resource centre is hosted on Elsevier Connect, the company's public news and information website.

Elsevier hereby grants permission to make all its COVID-19-related research that is available on the COVID-19 resource centre - including this research content - immediately available in PubMed Central and other publicly funded repositories, such as the WHO COVID database with rights for unrestricted research re-use and analyses in any form or by any means with acknowledgement of the original source. These permissions are granted for free by Elsevier for as long as the COVID-19 resource centre remains active.

Editorial

The host's angiotensin-converting enzyme polymorphism may explain epidemiological findings in COVID-19 infections

The outbreak of the COVID-19 pandemic in 2019/2020 has stimulated research on clinical laboratory findings in this condition, as evidenced by two recent papers in this journal [1,2]. We know that angiotensin-converting enzyme is involved in corona virus infection. Pathogenic corona viruses (severe acute respiratory syndrome corona virus [SARS-CoV] and SARS-CoV-2) bind to their target cells through angiotensin-converting enzyme 2 (ACE2), [3,4]. Not only has ACE2 facilitated the invasion of SARS virus for rapid replication, but also ACE2 is depleted from the cell membrane and therefore the damaging effects of Ang II are enhanced, resulting in acute deterioration of lung tissues [5]. The angiotensin-converting 1 (ACE1) enzyme is characterized by a genetic deletion/insertion (D/I) polymorphism in intron 16, which is associated with alterations in circulating and tissue concentrations of ACE. The D allele is associated with a reduced expression of ACE2. Although ACE2 and ACE share only 42% of amino acid identity, they both act as carboxypeptidases to cleave amino acids from the peptides' carboxyl terminal [6].

As this D/I polymorphism shows an important geographical variation [7], we postulated that the variability in D/I genotype distribution might partly explain the variable prevalence of the COVID-19 infection amongst continental European countries. Therefore, we compared the D-allele frequency of the ACE1 gene as obtained in 25 different European countries with the prevalence and mortality of COVID-19, as

calculated on March 20, 2020 by Johns Hopkins [8]. Fig. 1 shows the regression data. Data from Austria, Belgium, Croatia, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Israel, Italy, Lithuania, Moldova, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, and Turkey were included in the analysis. The log transformed prevalence of COVID-19 infections inversely correlates with the ACE D allele frequency: $\log(\text{prevalence; number of cases}/10^6 \text{ inhabitants}) = 6.358 - 0.079(\text{D-allele frequency, \%})$, $r^2 = 0.378$; $p = 0.001$. About 38% of the variability of the prevalence can be explained by the relative frequency of the ACE1 D-allele. Similarly, a significant correlation could be noted between COVID-19 caused mortality (Spearman $r = -0.510$, $p = 0.01$) and the prevalence of the ACE1 D-allele. It should also be noted that the two Asian countries which were initially severely hit by the virus, China and Korea, are also characterized by low D allele frequencies.

These data suggest that ACE1 D/I polymorphism may be regarded as a confounder in the spread of COVID-19 and the outcome of the infection in various European populations. These findings are in agreement with the role of ACE in pulmonary infections caused by corona viruses [4]. The ACE D/I genotype may affect the clinical course of the infection.

Fig. 1. Prevalence of COVID 19 in 25 European countries (on March 20, 2020 vs. ACE1 D-allele frequency (%): $\log(\text{prevalence; no. of cases}/10^6 \text{ inhabitants}) = 6.358 - 0.079(\text{D-allele frequency, \%})$, $r^2 = 0.378$; $p = 0.001$.
